

## TEAM 2 – Sprint 6 Review Report

### 1. Database Localization

We implemented the database localization strategy, updated the schema for multilingual support, configured UTF-8, and documented the chosen method in GitHub.

### 2. Statistical Code Review

We ran static analysis tools, collected metrics, identified code issues, and prepared a report with key findings and recommendations.

### 3. Code Clean-Up and Refactoring

We refactored the codebase based on review results, removed redundant code, fixed bugs, improved structure and naming, and verified functionality through unit tests.

### 4. Acceptance Test Planning

We defined acceptance criteria and created acceptance test cases covering functional, usability, and performance aspects.

### 5. Architecture Design Documentation

We updated the ER diagram and UML models and added all design files to the /docs directory in GitHub.
